WEBPAGE CASE STUDY

User Account Website

Features, HTML and CSS structure, and uses

IN THIS REPORT

The four account-related forms
How the HTML elements and CSS rules are organized
Possible learning and demonstration uses
The limits of the supplied forms

Prepared from the supplied casestudy3.html file. This report focuses on features, construction and uses; it leaves out a rendered-output section and source code.

1. Webpage overview

The file is a basic user-account webpage concept. It groups four common account tasks on one page: registration, login, password recovery and profile setup. Each task has a separate HTML form with labels, input fields and a button. The page is suitable for demonstrating form elements and simple browser-side validation in an introductory HTML and CSS exercise.

Page type	Static HTML page containing four form interfaces

Account tasks	Create an account, log in, request password recovery and enter profile details
HTML skills	Labels, inputs, required fields, input types, length and pattern constraints, buttons
CSS skills	Element selectors, colors, spacing and a focus-state selector

2. Form features

Registration

Requests a name, email and password. All three fields are marked required, and the password field sets a minimum length of eight characters. The email input type enables the browser's basic email-format check.

Login

Requests an email address and password, and marks both as required. The email input type provides basic browser validation.

Password recovery

Requests a required email address and includes a reset-password button. The HTML provides the interface, but it contains no password-reset process.

Profile setup

Requests a full name, city and mobile number. All fields are required; the mobile field uses a pattern requiring exactly ten digits (0 through 9).

Labels and controls

Labels use their for attribute to refer to the matching input id. This association helps identify each field and supports accessible form interaction. Buttons are marked as submit buttons by their type.

3. How the page is built

The file uses HTML for the page structure and CSS rules inside a **<style>** block in the document head for formatting. Keeping the two together makes the example easy to open and study as one file.

HTML structure

- **<head>** holds the browser tab title and embedded styles; **<body>** contains the visible content.
- **<h1>** names the page. **<h2>** headings introduce Registration Form, Login Form, Password Recovery and Profile Setup.
- Each **<form>** groups one task. **<label>** explains an input, and **<input>** provides the appropriate field type, such as text, email, password or telephone.
- Attributes such as **required**, **minlength="8"** and **pattern="[0-9]{10}"** describe simple browser-side field constraints.
- **
** elements place controls on separate lines, and a **<button type="submit">** offers an action for each form.

CSS styling

The style block uses selectors for elements such as **body**, **h1**, **h2**, **form**, **input** and **button**. These rules set the font, background and text colors, alignment, padding and margins. The **input:focus** selector applies a light-yellow background while an input field is focused. This gives a simple visual cue about which field is active.

4. Uses and important limits

For learning, the page can demonstrate how forms are divided into tasks, how labels connect to fields, and how common input types and validation attributes work. It can also serve as an early design starting point for an account page, once the form behavior and data handling are added.

The supplied forms do not have a configured submission destination, backend, database or authentication logic. Their required, email, minimum-length and phone-pattern settings provide only basic browser-side checks. They do not create an account, verify a password, send a recovery message or save a profile. In addition, the inputs have ids but no name attributes, so the file does not define named form values for ordinary form submission.

Because this is a learning example, it should not be used to collect real passwords or personal information. A real account system needs secure server-side processing, password handling and appropriate privacy protections.

Summary

This file is a beginner-level account-form demonstration. Its four forms and CSS focus rule illustrate useful HTML and styling concepts, while actual account creation, login, recovery and profile storage require additional implementation.

Code:

```
<!DOCTYPE html>
<html>
<head>
    <title>User Account Website</title>

    <style>
        body {
            background-color: lightblue;
            font-family: Arial;
```

```
        }

        h1 {
            background-color: darkblue;
            color: white;
            text-align: center;
            padding: 15px;
        }

        h2 {
            color: darkblue;
        }

        form {
            background-color: white;
            padding: 20px;
            margin: 20px;
        }

        input {
            padding: 8px;
            margin: 8px;
        }

        input:focus {
            background-color: lightyellow;
        }

        button {
            background-color: darkblue;
            color: white;
            padding:10px;
        }
    </style>
</head>
<body>
    <h1>User Account Website</h1>
    <h2>Registration Form</h2>
    <form>
        <label for="name">Name:</label><br>
        <input type="text" id="name" required><br>
        <label for="email">Email:</label><br>
        <input type="email" id="email" required><br>
```

```
        <label for="password">Password:</label><br>
        <input type="password" id="password" minlength="8" required><br>
        <button type="submit">Register</button>
    </form>
    <h2>Login Form</h2>
    <form>
        <label for="loginemail">Email:</label><br>
        <input type="email" id="loginemail" required><br>
        <label for="loginpassword">Password:</label><br>
        <input type="password" id="loginpassword" required><br>
        <button type="submit">Login</button>
    </form>
    <h2>Password Recovery</h2>
    <form>
        <label for="recoveryemail">Enter Your Email:</label><br>
        <input type="email" id="recoveryemail" required><br>
        <button type="submit">Reset Password</button>
    </form>
    <h2>Profile Setup</h2>
    <form>
        <label for="fullname">Full Name:</label><br>
        <input type="text" id="fullname" required><br>
        <label for="city">City:</label><br>
        <input type="text" id="city" required><br>
        <label for="phone">Mobile Number:</label><br>
        <input type="tel" id="phone" pattern="[0-9]{10}" required><br>
        <button type="submit">Save Profile</button>
    </form>
</body>
</html>
```

Output:

User Account Website
