WEBPAGE CASE STUDY

TechVision 2026

Features, HTML and CSS structure, and uses

IN THIS REPORT

What the conference webpage contains
How its HTML sections and CSS rules are organized
How the page could be used as an event-information site
What the registration form can and cannot do

Prepared from the supplied casestudy2.html file. This report focuses on the page content and construction; it does not include a rendered-output section or reproduce the source code.

1. Webpage overview

The file describes a one-page event website for **TechVision 2026**, presented as a national conference and seminar about technology, innovation and artificial intelligence. Its intended audience is students and people interested in technology. The content moves from event information to speakers, schedule, venue, registration and participation guidelines.

Page purpose	Share conference details and invite interested visitors to register
Event information shown	Theme and topics, speaker profiles, schedule, venue, date and time
Visitor actions	Jump to a section, fill in attendee details, choose a department and topic, then use the form buttons
Implementation	HTML content with CSS rules embedded in the document head

2. Main features

Event introduction

The About section explains the conference, identifies artificial intelligence as its theme, and lists web development, machine learning and cybersecurity as other topics.

Speaker profiles

Three speaker blocks pair each listed speaker name with a subject and job designation.

Timed agenda

A table organizes six schedule entries by time, session and speaker, from registration at 9:00 AM through a question-and-answer session at 3:30 PM.

Venue details

The venue section states the auditorium, college, city, date and event hours.

Registration fields

The form asks for a name, email, mobile number, college, department, chosen topic and reason for attending. Required fields are marked with the HTML required attribute.

Guidelines and contact

A list provides six participation rules. The footer includes an email address and a rights notice.

3. How the page is built

The document uses HTML to organize the information and CSS to describe its formatting. Both are stored in one file, which makes this a compact example for learning how a webpage is assembled.

HTML structure

- **<head>** contains the browser tab title and an embedded **<style>** block; **<body>** contains the page content.
- **<header>** groups the event name, subtitle, theme and date. **<nav>** holds six links to sections on the same page.
- **<section>** elements separate About, Speakers, Agenda, Venue, Registration and Guidelines. Their **id** values match the navigation links, such as *#agenda* and *#register*.
- ** ** repeats the speaker-card structure. Headings and paragraphs organize each speaker's details.
- **<table>**, **<tr>**, **<th>** and **<td>** organize the schedule into rows and columns.
- **<form>** groups labels, text inputs, selection menus, a text area and submit/reset buttons. The **<ul>** and **<li>** elements create the guidelines list.

CSS styling

The CSS rules are placed inside the style element in the head. Rules for element names such as **body**, **header**, **section**, **table** and **footer** apply across matching elements. Class selectors such as **.speaker** define reusable styling for each speaker block. The rules set font family, background and text colors, spacing, borders, table sizing and alignment.

The form-control rule groups **input**, **select** and **textarea** so those controls share width, padding, margins and borders. The **button:hover** rule changes the button background when a pointer hovers over it. This is a simple CSS interaction; it does not process registration data.

4. Uses and functionality notes

As a student project, this page demonstrates section-based HTML, same-page navigation, repeating content blocks, a data table, common form controls and basic CSS selectors. As a starting point for an event website, its sections provide a useful checklist of information attendees may need before a conference.

The form is presentational HTML, not a complete registration system. The required fields and email input type allow the browser to perform basic checks before submission. However, the form has no configured destination, no backend or database, and no registration-processing code. A visitor may press the submit button, but the page does not record an attendee or confirm a registration. The reset button clears the entered fields.

The contact email uses the example.com domain, and event names, venue details and speaker descriptions should be treated as sample page content unless independently confirmed. Replace example information and connect a secure server-side registration service before using a similar page for a real event.

Summary

TechVision 2026 is a static conference information page that combines event details with an HTML registration form interface. It is useful for learning page structure and styling; real registration requires additional functionality beyond the supplied file.
